

## **The care of the screws:**

Basically, we assume that you use a high-quality tool and the right tool size during cultivation and carefully deal with the naturally softer material stainless steel.

### **!! Important !!**

When attaching any screws screwed into an aluminum component, care must be taken to apply anti-seize mounting or screw paste to the thread.

This prevents the screw from being tightened.  
In places where there is no seal and steel meets steel, the screw should be secured with a screw lock (medium strength).

The right products are in our shop.
